

## ABSTRACT

[0037] To provide a vehicle stabilizer for high stress in which fatigue life of a bending portion can be prolonged and which can exhibit excellent durability.

[0038] A configuration of a bending portion 16, to which a maximum stress is applied and which is the most fragile part, of a vehicle stabilizer for high stress 10 is formed in a state which satisfies conditions:  $0 < \phi \leq 4$  and  $(\phi \times d/R) \leq 2$ , wherein  $d$  represents a material diameter before bending process,  $R$  represents a radius of bending of the bending portion 16,  $d_1$  represents a short radius of a cross section of the bending portion 16,  $d_2$  represents a long radius of a cross section of the bending portion 16, and a flat rate  $\phi$  of a cross section of the bending portion 16 is represented by the following equation:  $\phi = (d_2 - d_1)/d_2 \times 100$ . Accordingly, concentration of shearing stress on the bending portion 16 during a load input can be suppressed to prevent the vehicle stabilizer for high stress 10 from being broken due to the concentration of stress on the bending portion 16.
